Higher education in the digital era

Universities are among the oldest Institutions in the World

Karueein, Fez : 859

Al-Azhar, Cairo: 970

Bologna: 1088

.....

.....

.....

Sapienza, Rome: 1303

Will they survive in the new digital era?

MANY CHALLENGES INCLUDING:

Information more and more easily available

New distance learning actors

The Birth of the Internet

1993 - The WWW Revolution truly begins

- Number of Hosts 2 Million. 600 WWW sites.
- The Mosaic Web browser is released (by a group of 10 students from U of I at Champaign-Urbana) on the Net, gaining 2 million and fueling a 341,634% annual growth rate for Web traffic.

Artificial intelligence: opportunities and challenges

Artificial intelligence in university curricula

Machines will not replace immediately humans but, most probably, **humans using intelligent machines will replace soon humans NOT using them.**

Computer-calculated compounds

Researchers are deploying artificial intelligence to discover drugs.

BY NIC FLEMING

An enormous figure looms over scientists searching for new drugs: the estimated US\$2.6-billion price tag of developing a treatment. A lot of that effectively goes down the drain, because it includes money spent on the nine out of ten candidate therapies that fail somewhere between phase I trials and regulatory approval. Few people in the field doubt the need to do things differently.

Leading biopharmaceutical companies believe a solution is at hand. Pfizer is using IBM Watson, a system that uses machine learning, to

power its search for immuno-oncology drugs. Sanofi has signed a deal to use UK start-up Exscientia's artificial-intelligence (AI) platform to hunt for metabolic-disease therapies, and Roche subsidiary Genentech is using an AI system from GNS Healthcare in Cambridge, Massachusetts, to help drive the multinational company's search for cancer treatments. Most sizeable biopharma players have similar collaborations or internal programmes.

If the proponents of these techniques are right, AI and machine learning will usher in

an era of quicker, cheaper and more-effective drug discovery. Some are sceptical, but most experts do expect these tools to become increasingly important. This shift presents both challenges and opportunities for scientists, especially when the techniques are combined with automation (see 'Here come the robots'). Early-career researchers, in particular, need to get to grips with what AI can do and how best to acquire the skills they need to be employable in the job market of tomorrow.

AI IN DRUG DISCOVERY

From Siri to facial recognition, AI and machine learning are becoming familiar features of everyday life. But they could also save lives, by helping find new and better treatments for disease, faster.
